

Terminal Input Configuration

```
raw.c_lflag &= ~(ECHO | ICANON | ISIG); // Disable canonical mode, echo, and signals
```

The line of code you provided modifies the local modes (controlled by the ``c_lflag`` field) of the terminal, specifically targeting the following:

- ``ECHO``: Disabling this flag turns off echoing of typed characters to the terminal. Without this, user input is not displayed.
- ``ICANON``: Disabling this flag puts the terminal in non-canonical (raw) mode, meaning input is made available immediately, rather than after a newline (``Enter``).
- ``ISIG``: Disabling this flag prevents signal-generating characters like ``ctrl+C`` (interrupt signal) and ``ctrl+Z`` (stop signal) from being interpreted by the terminal. This means the terminal won't generate signals for these keys.

With this configuration, you disable line buffering, input echo, and signal handling for the terminal, allowing more control over input processing. You can now read input on a per-character basis without automatic signal handling or echo.

change this code to enable signal handling

```
raw.c_lflag &= ~(ECHO | ICANON); // Disable canonical mode, echo, and signals
```

To modify the code so that signal handling is enabled, you just need to remove the ``ISIG`` flag from the bitmask operation. Here's the updated code:

```
c
```

```
raw.c_lflag &= ~(ECHO | ICANON); // Disable canonical mode and echo, but keep signal handling
```

This will:

- **Disable echoing** (``ECHO`` is still disabled).
- **Disable canonical mode** (``ICANON`` is still disabled).
- **Enable signal handling** (since ``ISIG`` is not disabled).

Now, signal-generating keys like ``ctrl+C`` and ``ctrl+Z`` will work as expected, while the terminal remains in raw mode for immediate input handling.

```
raw.c_lflag &= ~(ECHO | ICANON | ISIG); // Disable canonical mode, echo, and signals  
enable signals
```

To modify your original code while enabling signal handling, you can specifically avoid disabling the `ISIG` flag. Here's the revised version:

```
c
```

```
raw.c_lflag &= ~(ECHO | ICANON); // Disable canonical mode and echo, but enable signals
```

Explanation:

- This keeps the `ECHO` and `ICANON` flags disabled (so input isn't echoed and the terminal remains in non-canonical mode).
- By **not** including `ISIG` in the bitmask, signal handling (like `Ctrl+C` for interrupt and `Ctrl+Z` for stop) is enabled.
